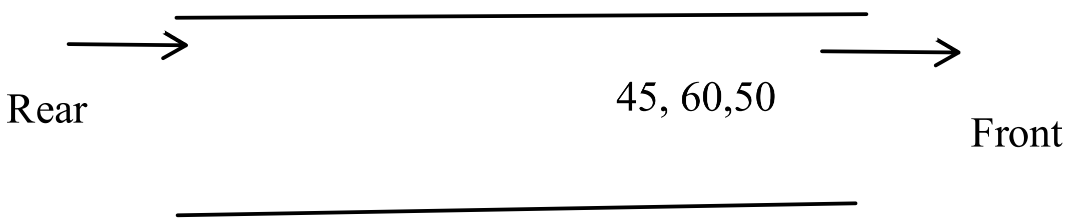
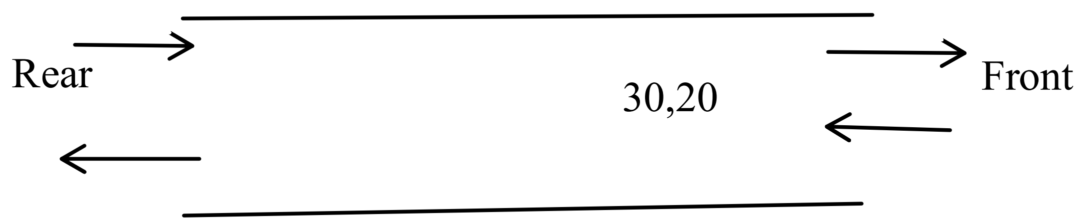
Collection
- List

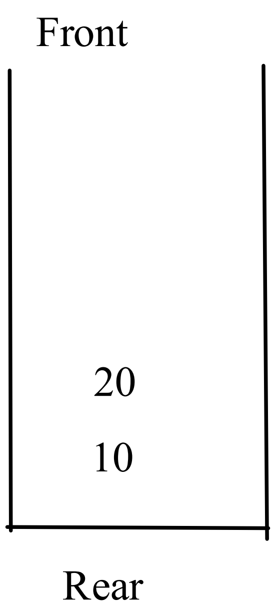
for-each
for-loop



Task
- Look for the Deque Interface
- understand the ArrayDeque class

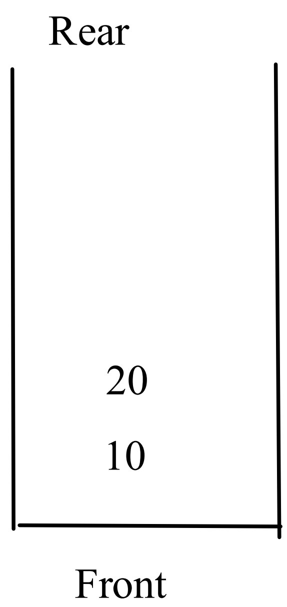
Deque<Integer> d1 = new ArrayDeque<>();





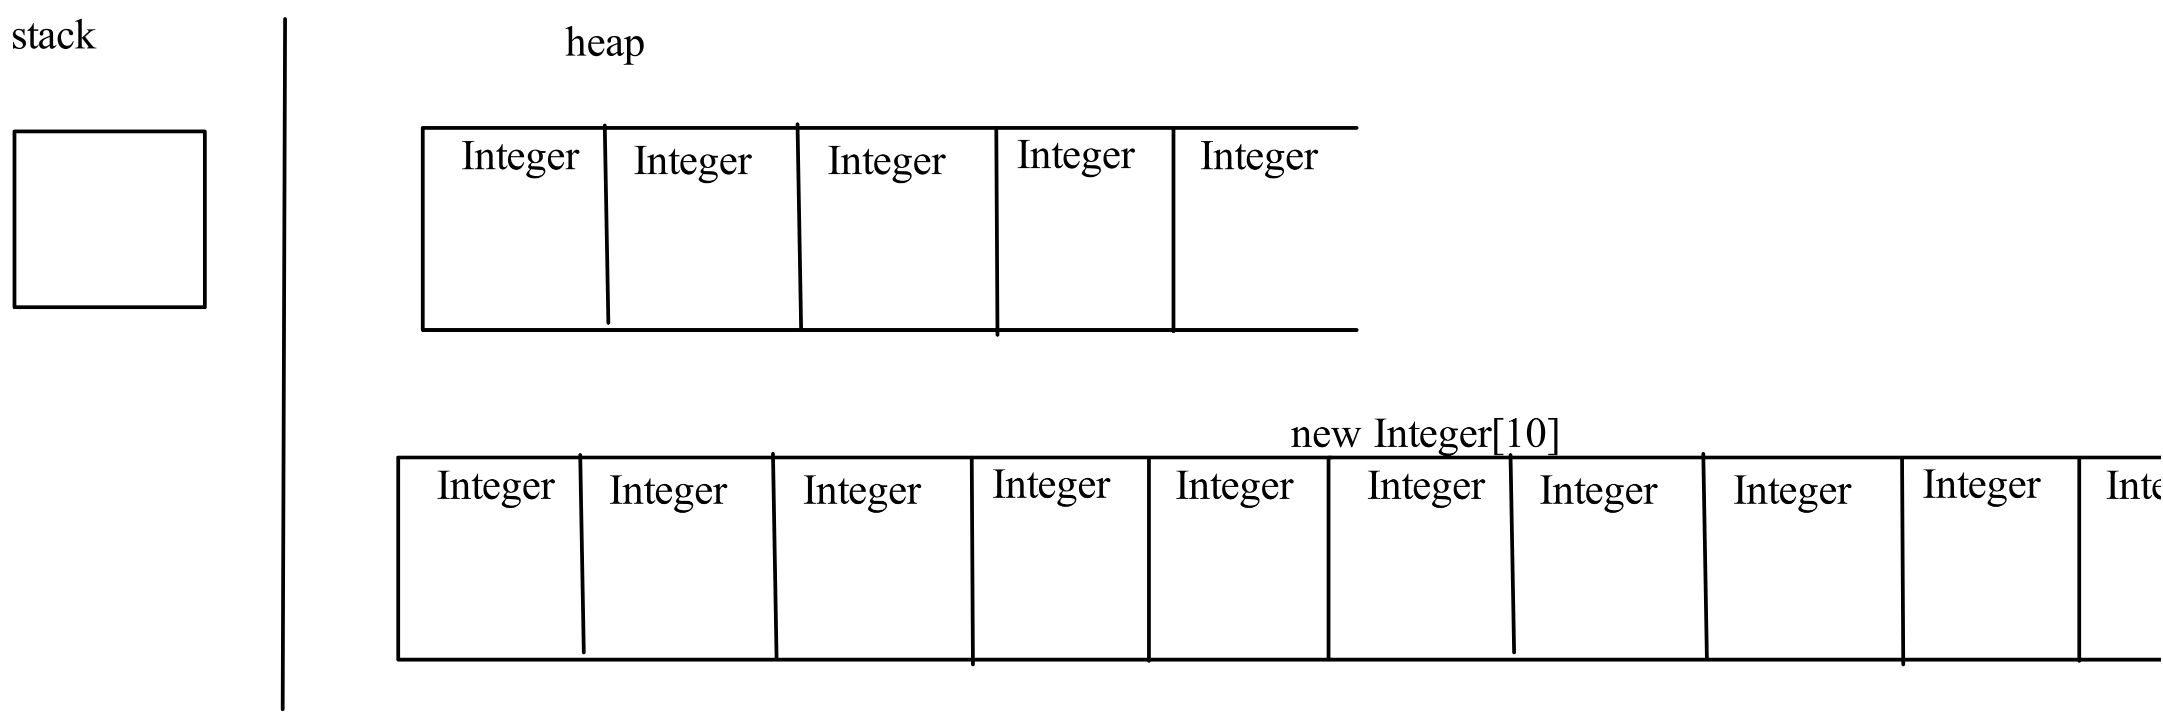
addFirst(10);
addFirst(20);
addFirst(30);

removeFirst(); // 30
removeFirst();//20



addLast(10);
addLast(20);

Task
use LinkedList class to have the implementation of
1. List
2. Queue
3. Stack



Employee[] arr = new Employee[5];

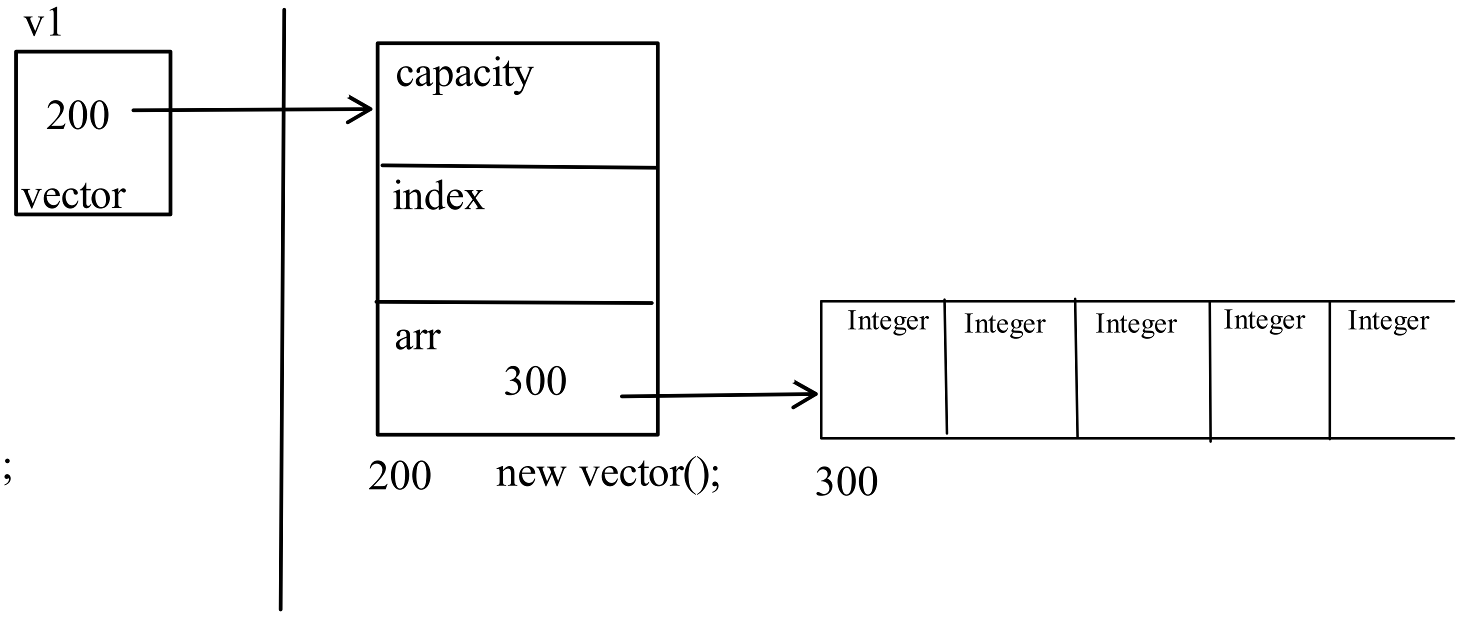
ArrayList<Employee>();
add(new Employee())

```
class vector{
int capacity = 10;
int index;
int arr[];

vector(){
        arr = new int[capacity];
}

add(int ele){
        index==capacity
                {
        int []temp = new int[capacity * 2];
        copy();
        }
}
}
```

vector v1 = new vector();



Priority Queue

Set
- Hashcode;

Preparation
- equals()
- Comparable
